Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

Analysis of Expressed Sequence Tags (ESTs) from Fetal and Adult Heart cDNA Libraries Myosin alkali light chain. R57637 were ligated, followed by digestion with NotI, for direction cloning into predigested lambda gt22. Method is described in J. Mol. Cell. Cardiol. (1994) 26, 1329-1333). mRNA was purified from human fetal hearts (10-12 weeks). cDNA was constructed using a NotI-Oligo dT adaptor-primer. Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

It hybridized to all spp. of mycobacteria tested, cross reacted to a few non-mycobacterial spp. The probe may be useful as an initial screen for mycobacterial infection. See also Q51735-45 and Q51747-59.

unlike int directly int directly int directly int directly into the cost of th	for human genes actually transcribed in vivo. Unlike the random genomic DNA sequence tagged sites (STSs), ESTs point directly to expressed genes The use of ESTs could facilitate the tagging of most expressed human genes within a few years at a fraction of the cost of complete genomic sequencing. Using PCR primers Q39419-Q39580 (sequences designed from the ESTs) sublocalisation of an EST can be achieved with panels of fragments from specific chromosomes or pools of large genomic clones in an analogous manner. This sequence represents EST0322.  Sequence 184 BP; 40 A; 52 C; 45 G; 47 T;  Sequence 184 BP; 51%; Score 16; DB 6; Length 184; tLocal Similarity 94.4%; Pred. No. 7.34e+00;
	Claim 3; Page 14; 23pp; English.  Claim 3; Page 14; 23pp; English.  Cliigonicleotide probe MK14-A consists of nucleotides 5-95 of MK14  (Q\$1735). It hybridized to all spp. of mycobacteria tested, but  cross reacted to a few non-mycobacterial spp. The probe may  be useful as an initial screen for mycobacterial infection.  See also Q\$135-5 and Q\$1747-59.  Sequence 91 BP; 5 A; 17 C; 15 G; 4 T;  ry Match 71.4%; Score 20; DB 9; Length 91;  t Local Similarity 0.0%; Pred.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Q59168;
The Expressed Sequence Tag was isolated from a human brain cDNA library as part of a large set of ESTs which can be used as markers for human genes transcribed in vivo. They can be used to facilitate tagging of most human genes, for mapping locations of expressed gene
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 T 6

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Matches
                                                                                                                                                                                                                                                                                                                                                          for human genes actually transcribed in vivo. Unlike the random genomic DNA sequence tagged sites (STSs), ESTs point directly to expressed genes. The use of ESTs could facilitate the tagging of most expressed human genes within a few years at a fraction of the cost of complete genomic sequencing. Using PCR primers 039419-039580 (sequences designed

Ş В ÷ Ъ Best Matches to transcription prods. of genes, useful for tagging genes, mapping chromosomes and tissue typing mapping chromosomes and tissue typing Claim 3; Page 171; 199p; English.
This sequence represents an EST (expressed sequence tag) ESTs are markers for human genes actually transcribed in vivo. Unlike the random genomic for human genes actually transcribed in vivo. from the ESTs) sublocalisation of an EST can be achieved with panels of fragments from specific chromosomes or pools of large genomic clones in an analogous manner. This sequence represents EST00337.

Sequence 406 BP; 103 A; 109 C; 114 G; 77 T; Q59292 standard; Q59292; DNA sequence tagged sites (STSs), ESTs point directly to expressed genes. The use of ESTs could facilitate the tagging of most expressed human genes within a few years at a fraction of the cost of complete genomic expressed sequence tag; human genome project; chromosome; Q39880 standard; DNA; 406 BP 12-FEB-1993; U01294. 12-FEB-1992; US-837195. The sequence is that of a human cyclin D3 pseudogene.
Sequence 2020 BP; 553 A; 485 C; 463 G; 519 New D-type mammalian cyclin - replaces CIN-type protein needed for cell start in budding yeast and is detected by antibodies or D-type; mammalian; CLN protein; protein deficiency; cell cycle start; type, and for prepn. of antisense sequences, probes and constructs. EST00337 has a "poor" coding probability as evaluated using the on chromosomes, for individual or forensic identification, for mapping tagging of most human genes, for mapping locations of expressed genes The Expressed Sequence Tag was isolated from a human brain cDNA library as part of a large set of ESTs which can be used as markers for human genes transcribed in vivo. They can be used to facilitate of most human genes Enriched oligonucleotides and corresp. sequences - used as markers for human genes transcribed in-vivo, facilitate tagging division hybridisation in biological samples to determine abnormal cell P-PSDB; R44806. 밁 Query Match Best Local S Matches /\*tag= g /note= "A to ( W09220796-A. Recombinant mammalian D-type cyclin - replaces a CLN-type protein essential for cell start in budding yeast, its antibodies and probes being useful in detecting D-type cyclin in biological cycle or that they do not undergo destruction. The human cyclin D genes share very high similarity over their entire coding region: 60% Disclosure; Fig 10; 75pp; English.

The sequences given in Q31876-77 represents the cyclin D2 and D3 pseudogenes. These sequences were identified during the chromosomal localisation of the D2 and D3 genes. These genes were contained /\*tag= c /note= "Frameshift mutation" 1679 Sequence See also Q31873-75. but are less closely related than the cyclin A and cyclin E genes. The cyclin D genes are more closely related than the cyclin B genes between D1 and D2, different mechanism to govern their periodic degradation during cell and B-type cyclins which targets them for ubiquitin-dependant degradation. This suggests that the D-type cyclins have evolved a a similar small size protein ranging from 289-295 amino acids. novel D-type cyclins disclosed by this invention were shown to encode within clones lambdaD2-G1 and lambdaD3-G5 respectively. Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

#### FEATURES COMMENT REFERENCE ORGANISM JOURNAL AUTHORS source repeat\_region repeat\_region repeat\_region repeat\_region misc\_feature repeat\_region repeat\_region repeat\_region repeat\_region repeat\_region repeat\_region repeat\_region true left end of clone L185F6 is at 31621 in this sequence. This sequence has been finished according to sequence map criteria as follows. An attempt is made to resolve all sequencing problems, constructed using flow-sorted human chromosome 4 from a Hamster-Human hybrid cell line ( $\tt UV20HL21-27$ ) containing human chromosomes 4, 8 and 21. L196E3 is contained in a clone contig spanning 2Mb which is described in Baxendale et al, Nature Cenetics 4 (1993) auspices of the U.S. Department of Energy. The library was such as compressions and repeats, but not necessarily within known annotated human repeat sequence elements (e.g. Alu). Where the humpub@sanger.ac.uk Submitted (31-OCT-1995) Sanger Centre, Hinxton, Cambridgeshire, Direct Submission Williamson, H. Eukaryotae; VECTOR: sCos1 Genome Center, sequence is ambiguous, there is an annotation using the 'unsure' The true left end of clone L196E3 is at 1 in this sequence. submissions. shorter because we only sequence overlapping sections once, This sequence is not the entire insert of clone L196E3. IMPORTANT: CB10 1RQ, England. E-mail enquires regarding this sequence: Vertebrata; 6196E3 is from cosmid library LAO4NCO1 constructed at the Human eature key. longer because we arrange for a small overlap between neighbouring 218-230 181- 186. Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

                                                                                                                                                                                                                                                               mutant p53 gene was obtained from plasmid Cx22A and cloned into pMM110 to generate pMM143. Recombination between pMM143 and ALVAC rescuing virus produced recombinant virus vCP270, which contains the vaccinia H6 promoted mutated human p53 in the C5 locus. The resulting virus may be used in a composition for inducing an antigenic or immunological response, ie. for immunisation against pathogens.

                                                        colon carcinoma, lymphoma, leukaemia, etc., suggesting that mutation of the p53 genes is involved in oncogenesis. Specifically 273 Arg is replaced by 273 His, a mutation found exclusively in tumour cells. Sequence 1182 BP; 277 A; 368 C; 303 G; 234 T;
                                                                                                                       genes. Variant forms of p53 are found in human breast,
                                                                                                                                    cancers caused by defective, mutant or absent cancer suppressor
                                                                                                                                                 p53 cDNA, or its gene prods., can be used to suppress and eradicate
                                                                                                                                                               Claim 5; Page 15; 25pp; English.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  1316 agcagggctcactccag 1332
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 mutant genes were derived from plasmids p53wtXbaISP6/T3, p53-21XbaI and p53-238XbaI respectively. The vaccinia H6 promotor was derived from plasmid pRW825 and precisely linked to the 5'-most region of the p53 gene. The expression cassettes generated by linking the vaccinia H6 promotor and the p53 genes may be cloned in to the poxvirus insertion plasmid, ALVAC, to give vCP207, vCP193 and vCP191 recombinant
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             DNA encoding cytokine and/or tumour associated antigen Example 15; Fig 18; 232pp; English.

Sequence 9502 BP; 1879 A; 2847 C; 2691 G; 2085 T; Claim 7; Pages 12-17; 35pp; Japanese. Q74770 encodes R66995 the HC-JI/protein, the cDNA can be used in the construction of an expression vector for the transformation. Q74770 plasmid, AIVAC, to give vCP207, vCP193 and vCP191 recombinant viruses, and into NYVAC to give vP1101, vP1096 and vP1098. The viruses may be used in a composition for inducing an antigenic immunological response, ie. for immunisation against pathogens. Sequence 1512 BP; 379 A; 419 C; 380 G; 334 T; DNA encoding cytokine and/or tumour associated antigen Example 15; Fig 17; 232pp; English.

The sequences given in Q67863-64 represent expression cassettes containing the vaccinia H6 promoter and the wild type human p53 gene in vP1101 and vCP207, respectively. These sequences were used in the construction of poxvirus based recombinant viruses expressing wild type 11-OCT-1994. 10-DEC-1993; Hepatitis C virus gene HC-J1/cDNA.
Hepatitis C virus; HCV gene HC-J1/cDNA; specific antibodies;
Hepatitis C virus. mutant genes were derived from plasmids p53wtXbaISP6/T3, p53-21XbaI and p53-238XbaI respectively. The vaccinia H6 promoter was derived from plasmid pRW825 and precisely linked to the 5'-most region of the p53 of a host cell. The host cell can then be used in the production HCV genes and the corresponding proteins - used in the production of anti-HCV antibodies and the detection of HCV infection P-PSDB; R66995. WPI; 94-362594/45. /\*tag= a J06284887-A. 01-AUG-1995 Q74770; promoter and the p53 genes may be cloned in to the poxvirus insertion and mutant forms of the human p53 gene product.
